BioMap and Living Waters:

Guiding Land Conservation for Biodiversity in Massachusetts

Introduction

In this report, the Natural Heritage & Endangered Species Program provides you with site-specific biodiversity information for your area. Protecting our biodiversity today will help ensure the full variety of species and natural communities that comprise our native flora and fauna will persist for generations to come.

The information in this report is the result of two statewide biodiversity conservation planning projects, **BioMap** and **Living Waters**. The goal of the BioMap project, completed in 2001, was to identify and delineate the most important areas for the long-term viability of terrestrial, wetland, and estuarine elements of biodiversity in Massachusetts. The goal of the Living Waters project, completed in 2003, was to identify and delineate the rivers, streams, lakes, and ponds that are important for freshwater biodiversity in the Commonwealth. These two conservation plans are based on documented observations of rare species, natural communities, and exemplary habitats.

What is a Core Habitat?

Both BioMap and Living Waters delineate **Core Habitats** that identify the most critical sites for biodiversity conservation across the state. Core Habitats represent habitat for the state's most viable rare plant and animal populations and include exemplary natural communities and aquatic habitats. Core Habitats represent a wide diversity of rare species and natural communities (see Table 1), and these areas are also thought to contain virtually all of the other described species in Massachusetts. Statewide, BioMap Core Habitats encompass 1,380,000 acres of uplands and wetlands, and Living Waters identifies 429 Core Habitats in rivers, streams, lakes, and ponds.

Core Habitats and Land Conservation

One of the most effective ways to protect biodiversity for future generations is to protect Core Habitats from adverse human impacts through land conservation. For Living Waters Core Habitats, protection efforts should focus on the **riparian areas**, the areas of land adjacent to water bodies. A naturally vegetated buffer that extends 330 feet (100 meters) from the water's edge helps to maintain cooler water temperature and to maintain the nutrients, energy, and natural flow of water needed by freshwater species.

In Support of Core Habitats

To further ensure the protection of Core Habitats and Massachusetts' biodiversity in the long-term, the BioMap and Living Waters projects identify two additional areas that help support Core Habitats.

In BioMap, areas shown as **Supporting Natural Landscape** provide buffers around the Core Habitats, connectivity between Core Habitats, sufficient space for ecosystems to function, and contiguous undeveloped habitat for common species. Supporting Natural Landscape was

BioMap and Living Waters:

Guiding Land Conservation for Biodiversity in Massachusetts

generated using a Geographic Information Systems (GIS) model, and its exact boundaries are less important than the general areas that it identifies. Supporting Natural Landscape represents potential land protection priorities once Core Habitat protection has been addressed.

In Living Waters, *Critical Supporting Watersheds* highlight the immediate portion of the watershed that sustains, or possibly degrades, each freshwater Core Habitat. These areas were also identified using a GIS model. Critical Supporting Watersheds represent developed and undeveloped lands, and can be quite large. Critical Supporting Watersheds can be helpful in land-use planning, and while they are not shown on these maps, they can be viewed in the Living Waters report or downloaded from www.mass.gov/mgis.

Understanding Core Habitat Species, Community, and Habitat Lists

What's in the List?

Included in this report is a list of the species, natural communities, and/or aquatic habitats for each Core Habitat in your city or town. The lists are organized by Core Habitat number.

For the larger Core Habitats that span more than one town, the species and community lists refer to the entire Core Habitat, not just the portion that falls within your city or town. For a list of all the state-listed rare species within your city or town's boundary, whether or not they are in Core Habitat, please see the town rare species lists available at www.nhesp.org.

The list of species and communities within a Core Habitat contains only the species and

Table 1. The number of rare species and types of natural communities explicitly included in the BioMap and Living Waters conservation plans, relative to the total number of native species statewide.

BioMap		
Biodiversity Group	Species and Verified Natural Community Types	
	Included in BioMap	Total Statewide
Vascular Plants	246	1,538
Birds	21	221 breeding species
Reptiles	11	25
Amphibians	6	21
Mammals	4	85
Moths and Butterflies	52	An estimated 2,500 to 3,000
Damselflies and Dragonflies	25	An estimated 165
Beetles	10	An estimated 2,500 to 4,000
Natural Communities	92	> 105 community types
Living Waters		
Biodiversity Group	Species	
	Included in Living Waters	Total Statewide
Aquatic Vascular Plants	23	114
Fishes	11	57
Mussels	7	12
Aquatic Invertebrates	23	An estimated > 2500

natural communities that were explicitly included in a given BioMap or Living Waters Core Habitat. Other rare species or examples of other natural communities may fall within the Core Habitat, but for various reasons are not included in the list. For instance, there are a few rare species that are omitted from the list or summary because of their particular sensitivity to the threat of collection. Likewise, the content of many very small Core Habitats are not described in this report or list, often because they contain a single location of a rare plant

BioMap and Living Waters:

Guiding Land Conservation for Biodiversity in Massachusetts

species. Some Core Habitats were created for suites of common species, such as forest birds, which are particularly threatened by habitat fragmentation. In these cases, the individual common species are not listed.

What does 'Status' mean?

The Division of Fisheries and Wildlife determines a status category for each rare species listed under the Massachusetts Endangered Species Act, M.G.L. c.131A, and its implementing regulations, 321 CMR 10.00. Rare species are categorized as Endangered, Threatened, or of Special Concern according to the following:

- **Endangered** species are in danger of extinction throughout all or a significant portion of their range or are in danger of extirpation from Massachusetts.
- **Threatened** species are likely to become Endangered in Massachusetts in the foreseeable future throughout all or a significant portion of their range.
- **Special Concern** species have suffered a decline that could threaten the species if allowed to continue unchecked or occur in such small numbers or with such restricted distribution or specialized habitat requirements that they could easily become Threatened in Massachusetts.

In addition, the Natural Heritage & Endangered Species Program maintains an unofficial **watch list** of plants that are tracked due to potential conservation interest or concern, but are not regulated under the Massachusetts Endangered Species Act or other laws or regulations. Likewise, described natural communities are not regulated any laws or regulations, but they can help to identify ecologically important areas that are worthy of protection. The status of natural

Legal Protection of Biodiversity

BioMap and Living Waters present a powerful vision of what Massachusetts would look like with full protection of the land that supports most of our biodiversity. To create this vision, some populations of state-listed rare species were deemed more likely to survive over the long-term than others.

Regardless of their potential viability, all sites of state-listed species have full legal protection under the Massachusetts Endangered Species Act (M.G.L. c.131A) and its implementing regulations (321 CMR 10.00). Habitat of state-listed wildlife is also protected under the Wetlands Protection Act Regulations (310 CMR 10.37 and 10.59). The **Massachusetts Natural Heritage Atlas** shows **Priority Habitats**, which are used for regulation under the Massachusetts Endangered Species Act and Massachusetts Environmental Policy Act (M.G.L. c.30) and **Estimated Habitats**, which are used for regulation of rare wildlife habitat under the Wetlands Protection Act. For more information on rare species regulations, see the *Massachusetts Natural Heritage Atlas*, available from the Natural Heritage & Endangered Species Program in book and CD formats.

BioMap and Living Waters are conservation planning tools and do not, in any way, supplant the Estimated and Priority Habitat Maps which have regulatory significance. Unless and until the combined BioMap and Living Waters vision is fully realized, we must continue to protect all populations of our state-listed species and their habitats through environmental regulation.

communities reflects the documented number and acreages of each community type in the state:

- **Critically Imperiled** communities typically have 5 or fewer documented sites or have very few remaining acres in the state.
- **Imperiled** communities typically have 6-20 sites or few remaining acres in the state.
- **Vulnerable** communities typically have 21-100 sites or limited acreage across the state.
- **Secure** communities typically have over 100 sites or abundant acreage across the state; however excellent examples are identified as Core Habitat to ensure continued protection.

BioMap and Living Waters:

Guiding Land Conservation for Biodiversity in Massachusetts

Understanding Core Habitat Summaries

Following the BioMap and Living Waters Core Habitat species and community lists, there is a descriptive summary of each Core Habitat that occurs in your city or town. This summary highlights some of the outstanding characteristics of each Core Habitat, and will help you learn more about your city or town's biodiversity. You can find out more information about many of these species and natural communities by looking at specific *fact sheets* at www.nhesp.org.

Next Steps

BioMap and Living Waters were created in part to help cities and towns prioritize their land protection efforts. While there are many reasons to conserve land – drinking water protection, recreation, agriculture, aesthetics, and others – BioMap and Living Waters Core Habitats are especially helpful to municipalities seeking to protect the rare species, natural communities, and overall biodiversity within their boundaries. Please use this report and map along with the rare species and community fact sheets to appreciate and understand the biological treasures in your city or town.

Protecting Larger Core Habitats

Core Habitats vary considerably in size. For example, the average BioMap Core Habitat is 800 acres, but Core Habitats can range from less than 10 acres to greater than 100,000 acres. These larger areas reflect the amount of land needed by some animal species for breeding, feeding, nesting, overwintering, and long-term survival. Protecting areas of this size can be

very challenging, and requires developing partnerships with neighboring towns.

Prioritizing the protection of certain areas within larger Core Habitats can be accomplished through further consultation with Natural Heritage Program biologists, and through additional field research to identify the most important areas of the Core Habitat.

Additional Information

If you have any questions about this report, or if you need help protecting land for biodiversity in your community, the Natural Heritage & Endangered Species Program staff looks forward to working with you.

BioMap: Core Habitat Summaries

Taunton

Core Habitat BM1166

This Core Habitat is one of the largest unfragmented and pristine areas of wetland habitat in eastern Massachusetts. The diverse natural wetland communities provide critical habitat for several rare insects and support globally rare and Endangered plant species. The area contains some of the most important habitat in the state for rare salamanders and turtles, including Blue-spotted Salamanders and Spotted Turtles. Much of this Core Habitat is protected as part of the Hockomock Swamp Wildlife Management Area.

Natural Communities

This Core Habitat contains diverse acidic peatlands and forested swamps. This includes the largest and highest-quality Acidic Graminoid Fen in the state, and also the largest Coastal Atlantic White Cedar Swamp in the state. Acidic Graminoid Fens are sedge and Sphagnum-dominated acidic peatlands that experience some groundwater and/or surface water flow but no calcareous seepage. Standing water is often present throughout much of the growing season. Meanwhile, Coastal Atlantic White Cedar Swamps are acidic, low nutrient basin swamps dominated by Atlantic White Cedar in the overstory and a mixture of species in the understory.

Plants

The state's largest population of the Endangered Round-Fruited Loosestrife, which usually grows along acidic ponds associated with large wetland complexes, is found within this Core Habitat. Several areas along the shore of Lake Nippenicket support populations of the lovely and globally rare Plymouth Gentian.

Invertebrates

Hockomock Swamp is home for many rare invertebrates, including at least three rare species of moths and several rare species of dragonflies and damselflies. For many of these species, Hockomock Swamp is within dispersal distance of several smaller Core Habitats nearby, and may serve as a reservoir population for these peripheral populations. Hockomock Swamp is actually a mosaic of different wetland habitats, including stands of Atlantic White Cedar trees that support a population of Hessel's Hairstreak butterfly, open sunny wetlands with Virginia Chain Fern that are fed on by the rare Chain Fern Borer moth, and Water-willow that is the host plant of the Water-willow Stem Borer moth, a species that occurs nowhere else outside of Massachusetts. Rare dragonflies and damselflies inhabiting Hockomock Swamp include the New England Bluet damselfly and Kennedy's Emerald dragonfly, which is not known to currently occur anywhere else in the state.

Vertebrates

This Core Habitat contains some of the most important areas of habitat in the state for Blue-spotted Salamanders and Spotted Turtles, including large expanses of forested and shrub wetlands and many Certified and Potential Vernal Pools interspersed with upland forest. This area also contains significant habitat for Four-toed Salamanders and likely Eastern Box Turtles and Blanding's Turtles as well. The Core Habitat provides important breeding habitat for birds characteristic of forested and shrub swamps of southeastern Massachusetts. Approximately 20% of this Core Habitat is not currently protected. Especially important are unprotected concentrations of Potential Vernal Pools along the northwestern, northern, southeastern, and southern borders of the Core Habitat.

BioMap: Core Habitat Summaries

Taunton

Core Habitat BM1176

This large and diverse Core Habitat encompasses habitat for state-listed rare plants, amphibians, reptiles, marsh birds, and grassland birds. It includes over 10 miles of the Taunton River and substantial reaches of several of its tributaries. Also included are a variety of forested wetlands, including several large Alluvial Red Maple Swamps. Much of this key Core Habitat remains unprotected.

Natural Communities

This Core Habitat contains a variety of forested swamps. It includes several large Alluvial Red Maple Swamps with intact hydrology and minimal disturbances. Alluvial Red Maple Swamps are a type of Red Maple Swamp that occurs in low areas along rivers and streams. Regular flooding enriches the soil with nutrients, resulting in an unusual set of associated trees and plants. One of the swamps in this complex is influenced by seepage and described as the only known one of its kind in the state.

Plants

A population of the Threatened Pale Green Orchis is found along a vernal pool near the Taunton River.

Vertebrates

This Core Habitat encompasses significant riverine, wetland, and upland habitats for Red-bellied, Blanding's, Wood, Spotted, and Eastern Box Turtles. Significant habitat for Four-toed Salamanders is also present. Two important areas of freshwater marsh provide habitat for rare birds, including Pied-billed Grebes, American Bitterns, and King Rails. Significant breeding habitat for Upland Sandpipers and Grasshopper Sparrows is also present. Relatively large areas of habitat exist in this Core Habitat for birds of forested wetlands. Over 90% of this large and diverse area is unprotected, and management may be needed to mitigate the fragmentation effects of several paved roads that impair wetland and riparian connectivity. Further, grasslands in the area need annual mowing and, ideally, occasional burning.

Core Habitat BM1180

This large, multi-lobed Core Habitat contains riparian and wetland habitats adjacent to the Threemile River and its tributaries, as well as many Potential Vernal Pools. These areas provide significant habitat for four rare turtle species. Also included is a large and high-quality Small-River Floodplain Forest community that supports the rare Cat-Tail Sedge.

Natural Communities

This Core Habitat contains a large and high-quality Small-River Floodplain Forest in Taunton that is free of exotic plant species and well-buffered by surrounding natural forest. Small-River Floodplain Forests are Silver Maple-Green Ash forests occurring on alluvial soils of small rivers and streams. In Norton, a good example of an Alluvial Red Maple Swamp extends along the river, fairly well-buffered from development and with few exotic species. Alluvial Red Maple Swamps are a type of Red Maple Swamp that occurs in low areas along rivers and streams. Regular flooding enriches the soil with nutrients, resulting in an unusual set of associated trees and plants.

BioMap: Core Habitat Summaries

Taunton

Plants

A disjunct population of the Threatened Cat-Tail Sedge, which has a thick inflorescence reminiscent of the Common Cattail, is found here within an emergent marsh in a floodplain. Most populations of this sedge are found in central Massachusetts.

Vertebrates

Numerous meandering stream channels with a good interspersed of bordering wetlands and undeveloped uplands, combined with several observations of turtles, suggest that habitats here support significant populations of Wood Turtles and Spotted Turtles. A recent observation of a Blanding's Turtle, in the context of the long, meandering reaches of the Threemile River and its tributaries, along with the abundant bordering wetlands, suggests that this area may also support a significant population of this species. In fact, this site may represent the southernmost population of Blanding's Turtles known in New England. This Core Habitat also encompasses significant habitat for Eastern Box Turtles, and likely for Four-toed and Marbled Salamanders as well. Most of this Core Habitat is currently unprotected from development.

Core Habitat BM1196

Invertebrates

This Core Habitat includes an Atlantic White Cedar Swamp that is habitat for Hessel's Hairstreak butterfly. Although surrounded by development, this Core Habitat is unfragmented and of sufficient size to support a population of Hessel's Hairstreak. It is also located less than 5 km from the population at Hockomock Swamp, which may allow for occasional movement of individuals between these two sites. Much of this Core Habitat is on protected municipal land, but conservation of currently unprotected lands within this Core Habitat is desirable to increase the amount of contiguous protected habitat, thus helping to ensure the long-term survival of this rare species.

For more information on rare species and natural communities, please see our fact sheets online at www.nhesp.org

BioMap: Core Habitat Summaries

Taunton

Core Habitat BM1204

This Core Habitat encompasses one of the best Coastal Plain Pondshores in the state, which, along with several other ponds, supports rare damselflies, dragonflies, moths, and rare plants such as the Endangered Three-Angled Spike-Sedge. The Core Habitat also contains a variety of small freshwater wetlands, cranberry bogs, and upland forests that provide significant habitat for two state-protected species of turtles. The western portion of this Core Habitat is protected as the Massasoit State Park, but further conservation of important areas in the northern and eastern portions would help ensure the long-term survival of the rare species found here.

Natural Communities

In Taunton, this Core Habitat contains the highest-quality unprotected Coastal Plain Pondshore community in the state. Coastal Plain Pondshores are globally rare herbaceous communities of exposed pondshores with a distinct Coastal Plain flora. Water levels change with the water table, typically leaving an exposed shoreline in late summer where many rare species grow. Despite the adjacent railroad embankment, this pond is in excellent condition, buffered by naturally vegetated land, not affected by cranberry operations or public water supply wells, and without houses on its shore. This is one of the few remaining intact Coastal Plain Pondshores in the southeast.

Plants

One of only three Massachusetts occurrences of the Endangered Three-Angled Spike-Sedge is growing within this Core Habitat. It is the only mainland occurrence of this species in the state.

Invertebrates

This Core Habitat contains a network of various wetlands, including Coastal Plain ponds such as Thatchers Pond, Furnace Pond, Kings Pond, Middle Pond, Big Bearhole Pond, and Dunham Pond, all of which are important habitat for the Comet Darner dragonfly, the Pine Barrens Bluet damselfly, and the Water-willow Stem Borer moth. The relatively large size of this Core Habitat, along with the number of separate ponds and other wetland habitats, provide an excellent opportunity for the long-term conservation of rare species inhabiting the area.

Vertebrates

This Core Habitat contains ponds, cranberry bogs, small freshwater wetlands, and upland forests. The area provides significant habitat for Spotted Turtles, Eastern Box Turtles, as well as for forest birds. The Core Habitat boundaries are determined by major roads and the development along them. The northern and eastern portions of this Core Habitat need protection.

Living Waters: Core Habitat Summaries

Taunton

Core Habitat LW080

This Core Habitat provides key habitat for one of two populations of the state-Endangered Atlantic Sturgeon in the Commonwealth. The largest of Massachusetts' freshwater fishes, the Atlantic Sturgeon is a prehistoric-looking fish, with bony plates along its side. More studies are needed in the Taunton River to identify spawning (breeding) areas for this species.

Core Habitat LW228

The Taunton River supports six of the state's twelve freshwater mussel species, including the rare Tidewater Mucket. This species is more likely to be found in ponds, and this occurrence is one of only two known river occurrences in Massachusetts. The Taunton River is slow-flowing, and has a river bed of softer sands and silts, although mussels are most often found in the sections with firmer substrates.

Core Habitat LW233

The Three Mile River supports three freshwater mussel species, including the rare Eastern Pondmussel and the uncommon Eastern Lampmussel. The Eastern Pondmussel is only known from five rivers in southeastern Massachusetts. Here it has been found dotted along the soft, sandy river banks.
